

Rock #6: AI-Generated Check-In Prompts

Business Case One-Pager: v2, post CFO stress test

\$388.8K ARR Protected Base case, Yr 1	10.5 mo Payback vs. 12-mo hurdle	18 pts KR1 Target Lift 22% → 40%	2 Gates Kill Criteria Wk 8 + Wk 26
---	---	---	---

THE BET

Increase Day 90–180 return rate (KR1: 22% → 40%) for high-engagement users who have gone quiet, by making the product demonstrably "remember" what helped them, not prompting on a fixed schedule. This is a retention save-play against an already-monetized cohort, not an acquisition play: value comes from ARR protected, not ARR created.

RETURN MODEL

Target cohort	40,000 high-engagement, now-lapsed users / yr
Premium ARPU	\$15/month
Baseline → target 6-mo retention	48% → 65% (KR2)
Project cost (eng + design + clinical)	\$340,000
ARR protected, base case	\$388,800 → 10.5-month payback

LOAD-BEARING ASSUMPTION

Personalization must read as "remembered," not "recycled." This is binary if false, the bet is null, not smaller, so it cannot be sensitized by percentage. It is tested directly by the Week 8 gate below, not modeled financially.

SENSITIVITY: CLINICAL NARROWING (THE CORRECT 20–30% TEST)

Scenario	ARR Protected	Payback	vs. 12-mo Hurdle
Base case	\$388,800	10.5 mo	Clears
Clinical narrows 20%	\$311,040	13.1 mo	Modest miss
Clinical narrows 30%	\$272,160	15.0 mo	Fails hurdle

Even at 30% degradation, ARR protected stays positive; the 12-month payback hurdle is what actually breaks, not the return itself.

KILL CRITERIA

Tier 1: Week 8	Opt-out/complaint rate > 2× confirmed baseline, or clinical veto not approved. → Trigger mechanism stopped & rebuilt. One re-attempt cycle only.
Tier 2: Week 26	Incremental lift vs. control < 8 pts, or ARR protected < \$200K. → Trigger-system expansion paused; differentiator claim formally downgraded pending re-justification.
